

SPF SIG Priority Focus Tool #2B  
Data Consolidation: PNMM

---

---

**LSAA Name:**

**Person Completing Form:**

**Submission Date:**

*You do not need to complete this tool if you were not able to collect additional consequence or consumption data.*

Recall that it was not recommended that you collect more detailed Emergency Department Encounter data or Medical Examiner data as they are unlikely to provide much additional useful information. Therefore, blank versions of these tables are not provided. Further, blank tables for PNA data or Higher Ed Survey consumption data are not provided because if you were given access to that data, Bach Harrison can send it to you already in a table. Simply attach them to this document or copy and past them below under Consumption Data.

If you were able to collect additional consequence data or consumption data (beyond the PNA or Higher Ed Survey), create tables below to consolidate the data that you collect for your consequences and consumption patterns.

To calculate rate, divide the number of interest by the population (e.g., number of overdoses divided by the total number of people in the population). Then multiply the result by 100,000 to get the rate per 100,000 people.

$$(\text{Number of interest} \div \text{Population}) * 100,000$$

When creating the tables, you should complete the top row with the LSAA total (if available) and subsequent rows as needed based on the number of communities you were able to get data broken down into. You should also indicate the year in the title that the data represents. If you have multiple years available, complete the first table in each set for the most recent year available and the second table (with more general information) for all years. This is similar to the EPI Profile report format.

Consequence Data

*If you have collected additional consequence data, please provide it here.*

Consumption Data

*If you have collected additional consumption data beyond that from the PNA or Higher Ed survey, please provide it here.*
